Aluminum shadow-gap profile ideal for LED strips installation including diffuser suitable for drywall and masonry

Delivery and installation of the wall-flush shadow-gap profile in aluminum with protection foil to create a perfect shadow-gap illuminated with LED strips.

For a seamless connection in the corners, the profiles must be mitred.

The profiles are fixed vertically and horizontally to the substructure or on the first layer. The second layer will be put on the aluminum profile and well bolted with self cutting screws. For masonry the profiles are fixed to the substructure using an appropriate mounting foam and screwed to the wall.

The height will be defined by the construction management.

The LED strips are supplied and installed by an electrician. The supplied diffuser can be used to cover.

For plaster board: 12,5mm
and/or standard plaster depth: 15mm
