Aluminum shadow-gap profile for ceilings ideal for LED strips installation including diffuser suitable for drywall and masonry

Delivery and installation of the wall-flush shadow-gap profile in aluminum for ceilings with protection foil to create a perfect shadow-gap illuminated with LED strips.

For a seamless connection in the corners, the profiles must be mitred.

The profiles are glued and screwed absolutely horizontally to the already plastered or filled side wall. The plasterboard panels for the ceiling are firmly screwed to the upper lip using self-cutting screws. In the middle of the room, the plasterboard panels are attached to the suspension points provided.

The height will be defined by the construction management.

The LED strips are supplied and installed by an electrician. The supplied diffuser can be used to cover.

For plaster board: 12,5mm
